

RYA DIESEL ENGINE COURSE

I have two totally different engines for students to work on. One, a four cylinder "Watermota modified Ford" diesel. The other, a single cylinder "Yanmar" YSM 8.

To protect your premises, a plastic sheet will put down on the floor to protect the surface. Both engines are mounted on castors and can then be raised to working height on adjustable legs. The only assistance I would need is to lift the engines in and out of my vehicle.

Each engine is in full "running" condition. This allows all the usual checks and servicing like oil, fuel filters, impeller changes etc to be undertaken by students during the course. A comprehensive range of spare/demonstration parts are also available for use.

The course is very "practical" based, as confirmed in recent feedback;

"Excellent course & top class delivery".

"Should be longer and include the outboard as part of the main course".
